

Malawi Automatic Weather Stations data exchange

Enrico Fucile (WMO Secretariat)
Rodrick Walusa (DCCMS Malawi)

WMO OMM
World Meteorological Organization
Organisation météorologique mondiale

Manned stations on GTS

- 23 stations making 2 observations per day (few of them 4 obs/day)
- Very few data where received by NWP Centres.
- Some GTS problems resolved
- AWS on OSCAR → more back dots
- More data received, but
 - Most of the stations are not making pressure observation
 - Number of observations per day are not enough and not regular

WMO OMM

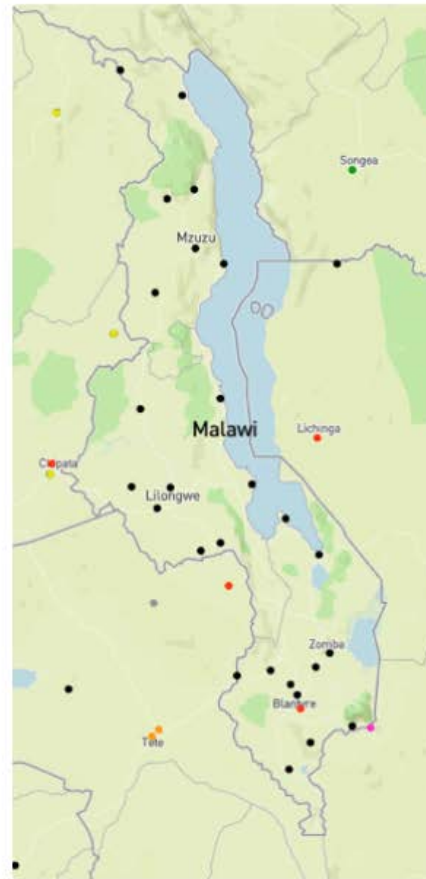

Fig.1 2021/02

- a lack of data
- one observation only

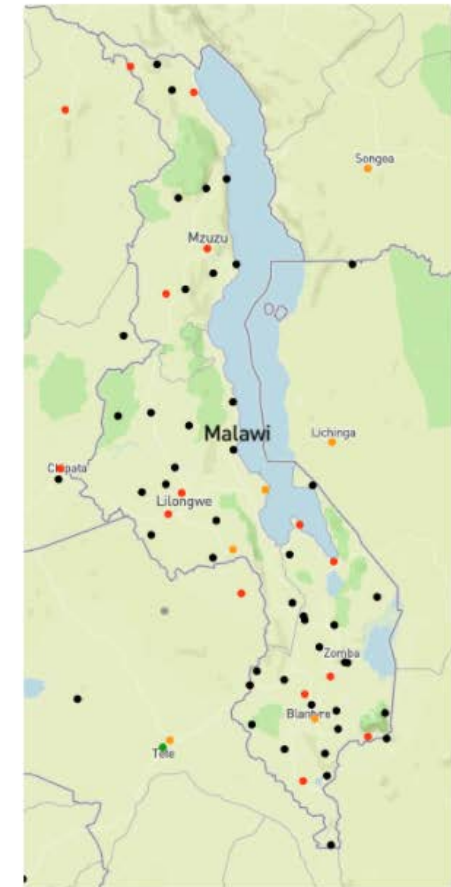

Fig. 2 2021/05

- a lack of data
- one observation only
- two observations

Problem statement

Malawi NMHS manages 44 Campbell Scientific automatic weather stations (AWS), providing data through a GSM connection and internet.

These are the issues related to the AWS data:

- transmission problems
 - SIM card has been disabled
 - GSM signal is too weak
- AWS data are used only locally and not exchanged internationally
- Campbell Scientific software cannot produce BUFR. The WIGOS station identifier (WSI) cannot be encoded in SYNOP, therefore BUFR is required
- data are received on a PC in Blantyre at DCCMS headquarters, which constitute a single point of failure and is not sufficient to guarantee the required continuity and resilience of the transmission

WMO OMM

Project objectives

- Continuous and reliable provision of hourly real-time data from 44 stations to WMO NWP Centers in BUFR format through GTS and WIS 2.0 Message Queuing Protocols.
- Optimization of the acquisition system for cloud services for sustainability purposes.
- Development of a turn-key solution to be delivered to other Countries.

WMO OMM

Project costs

- Amazon services one year around \$10K (**first year provided for free by Amazon**)
- Implementation of Campbell Sci. software on Amazon cloud service provided at no cost by Campbell Sci.
- Implementation of BUFR production provided by Campbell Sci. at no cost.
- Cost of WIS2 type transmission to be determined and to replace GTS costs in the longer term.
-  Cost of improving GSM reception around **\$6000**
- Training for IT staff in Malawi to be provided by the Secretariat and Amazon (no cost for DCCMS Malawi)

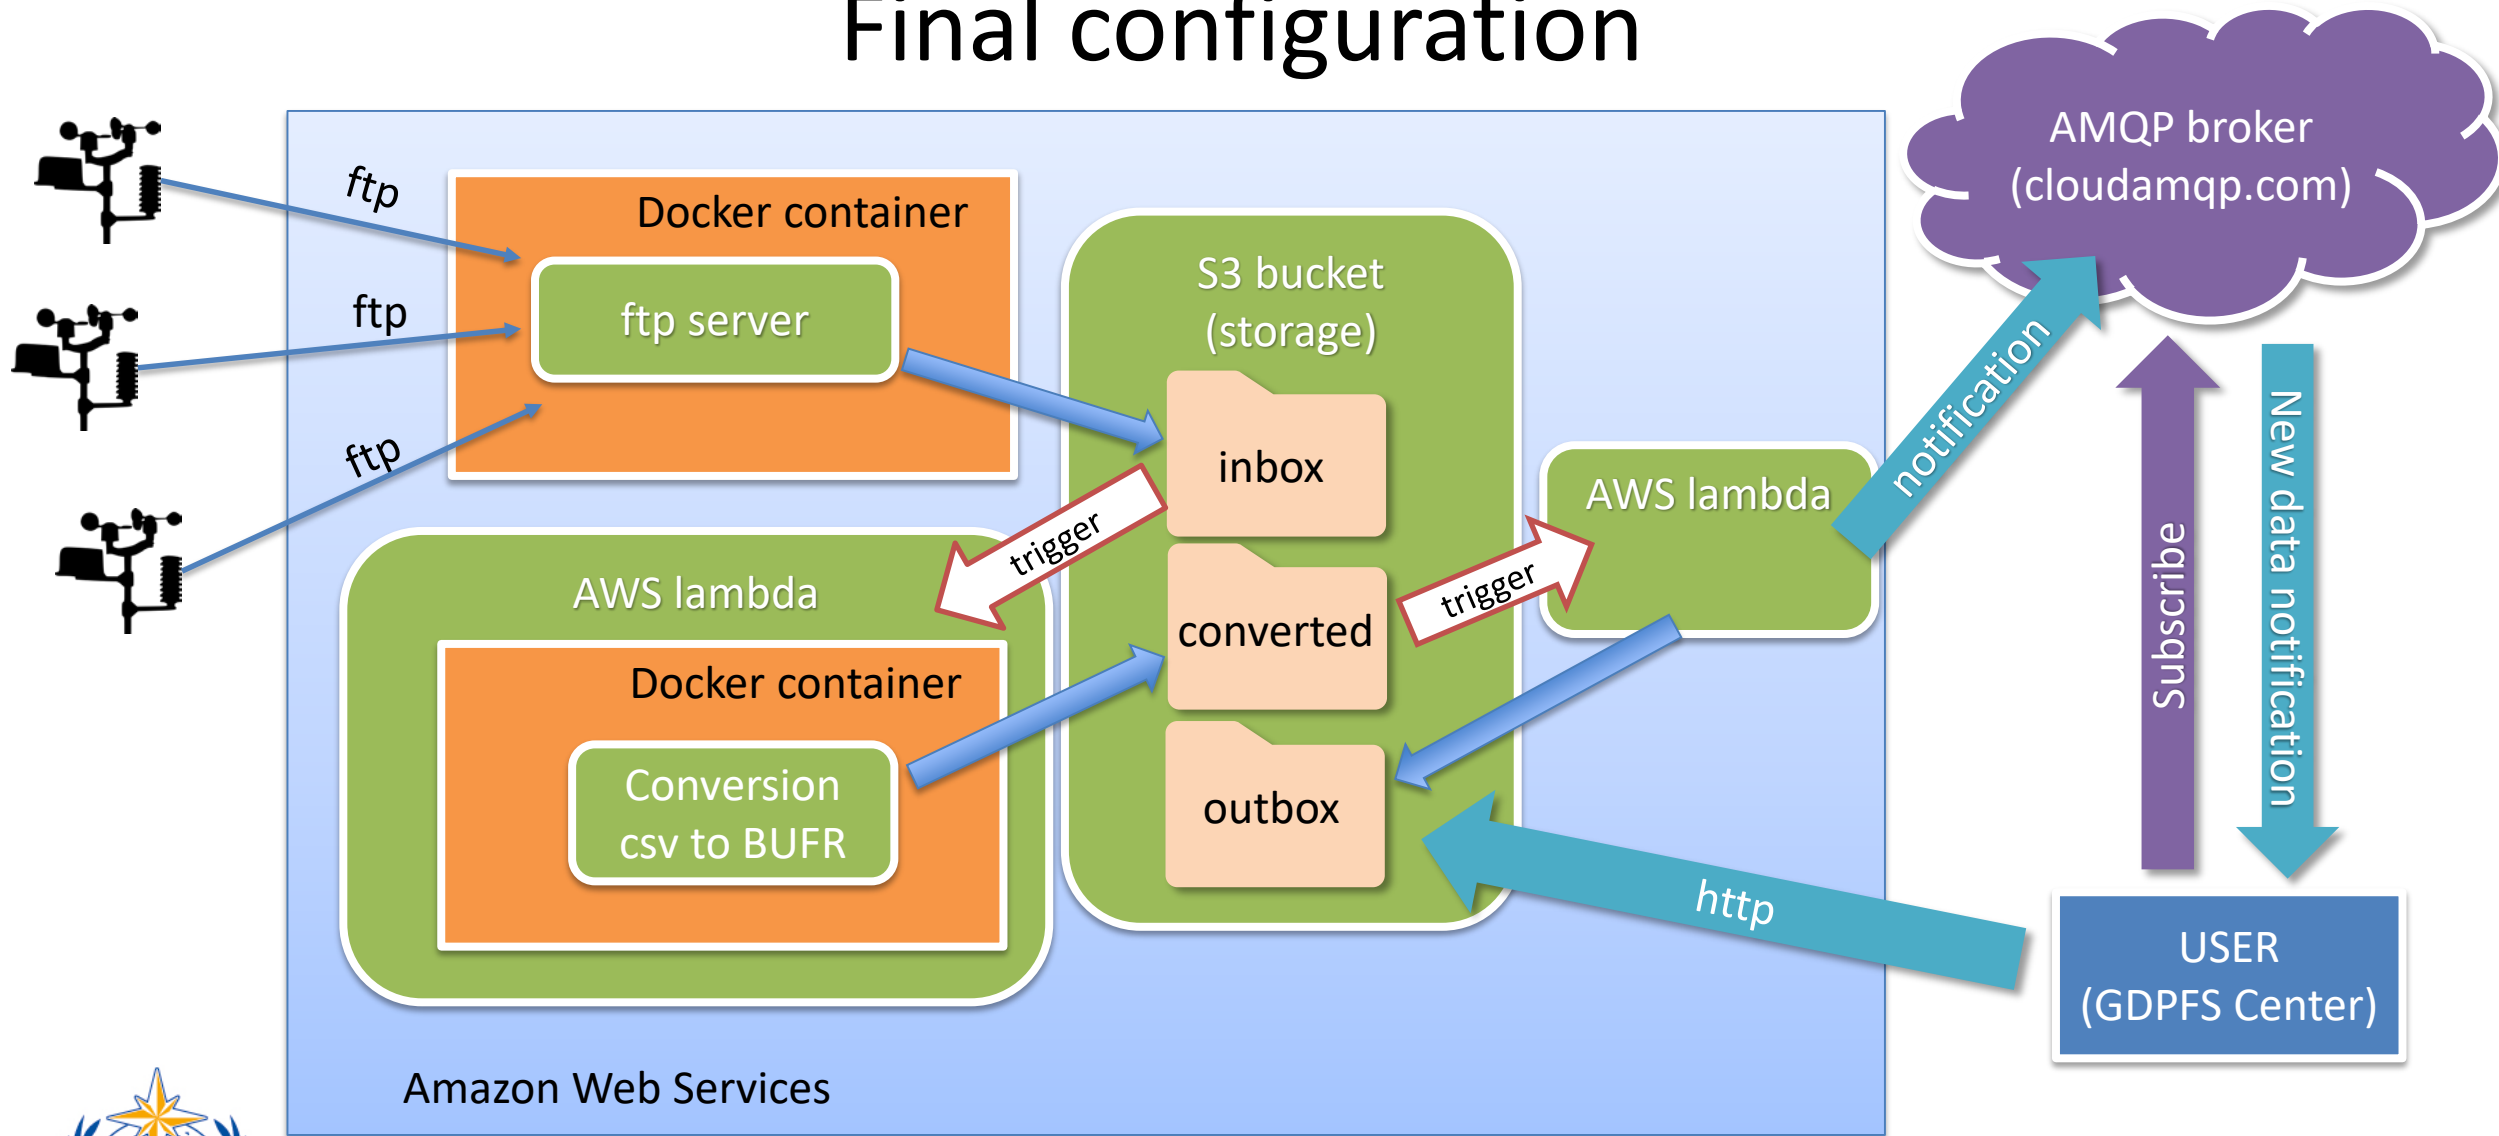

WMO OMM

Project plan

WMO OMM

Final configuration

WMO OMM

Costs

Current configuration

Service	Yearly cost
EC2 Windows + MS SQLServer	~ \$10000
S3 storage + Lambda	<\$100
AMQP (cloudAMQP.com)	\$600

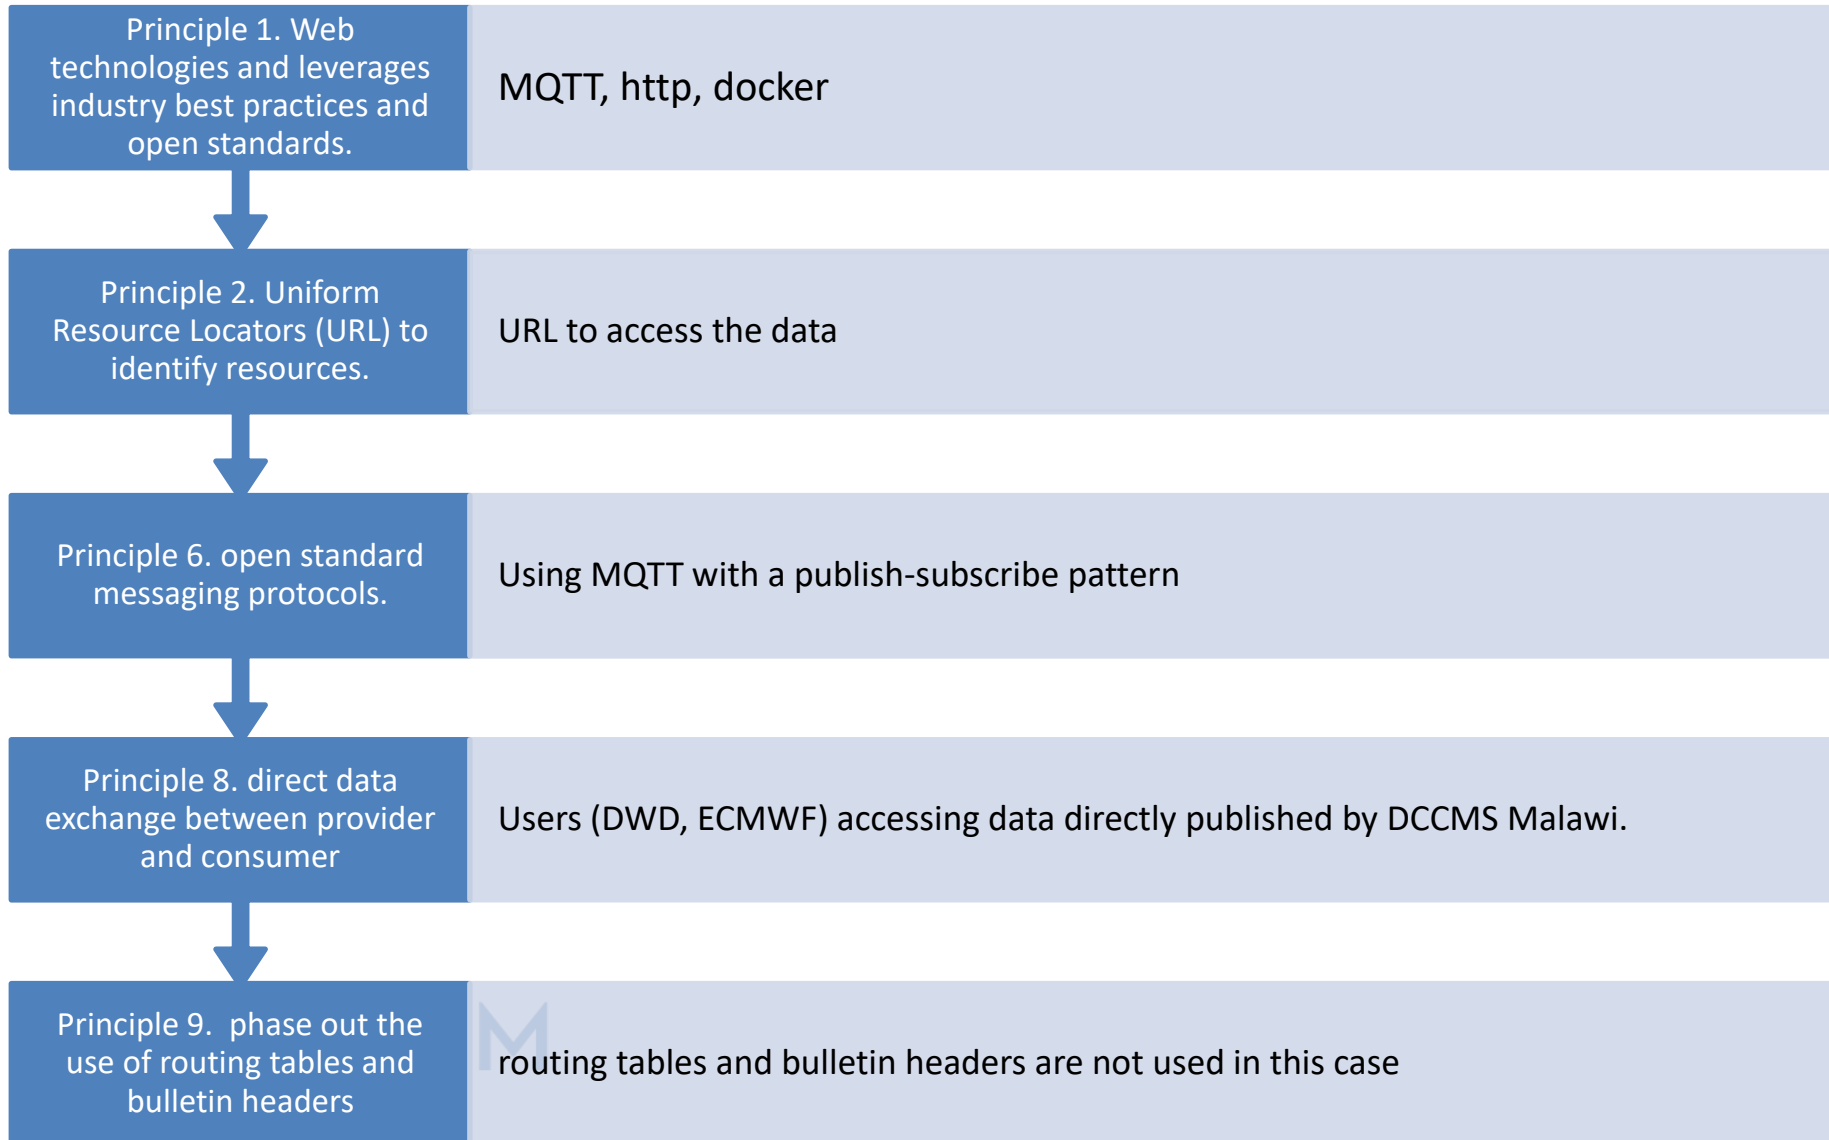

Final configuration

Service	Yearly cost
AWS Fargate (docker container) + Elastic Load Balancing + Elastic container registry	~ \$1600
S3 storage + Lambda	<\$100
AMQP (cloudAMQP.com)	\$600

WMO OMM

WIS 2 Principles in the project

Project data standards

- BUFR to be exchanged on the GTS and WIS2
- Conversion from ASCII format to BUFR to be implemented using ecCodes and provided as a python script and in a docker container.
- Training on BUFR will be provided by the Secretariat to DCCMS Malawi.

WMO OMM

Project metadata standards

- No search metadata uses
- Data will be published on WIS as all GTS data

WMO OMM

Data discovery

- No data discovery implemented in the project

WMO OMM

Data exchange

- Exchange of BUFR data through GTS and WIS2 protocols.

WMO OMM

Input to WIS2

- Important to foster adoption of cloud services to provide turn-key solutions.
- BUFR presents a barrier that is extremely difficult to address. More tools and training needed to support BUFR data exchange.
- Difficulties are encountered in data exchange from the station to the acquisition centre at national level. Support to improve national exchange is required.
- Internet availability and costs can be a limitation in LDCs.
- Observing station manufacturers provide closed solutions to access data from the stations. Open standards would be helpful at that level.
